YEAR OF ACQUISITION

The percent good factor (%GD) schedules for the YEAR OF ACQUISITION METHOD are to be used when original cost is known by year of acquisition. Refer to the property category, such as Furniture & Fixtures, to determine the appropriate useful life %GD schedule. The original cost is multiplied by the Index Factor, which equals the replacement cost; then multiply by the %GD for the acquisition year to arrive at a calculated rendered value for that category.

BOOK VALUE TO MARKET VALUE CONVERSION

If the original cost by year of acquisition is not known, but the original cost and depreciation are known by category, the tables for BOOK VALUE / MARKET VALUE CONVERSION are to be used. First, divide the accumulated depreciation by the original cost to determine the percentage of book depreciation. The percentage of book depreciation is used to determine which present value factor (PVF) to apply. The original cost is multiplied by the PVF factor to arrive at a calculated rendered value for that category.

NET BOOK VALUE

Original cost less accumulated depreciation equals NET BOOK VALUE. The net book value is calculated and compared to the BOOK VALUE / MARKET VALUE CONVERSION METHOD of valuation. If the net book value is greater than the book value / market value method, then the net book value is used to arrive at a calculated rendered value for that category. The NET BOOK VALUE is **not** used to override the YEAR OF ACQUISITION METHOD of valuation.

NEW AGE MIX (NAM)

The New Age Mix (NAM) is an obsolescence factor that is applied when most of the assets in a category are newer, therefore compensating for the age mix being out of balance. Each year life, the computer schedules, and the specific equipment schedule have separate NAM factors. Please note the new age mix schedule does not apply to vehicles.

1978	3.247												

Note 1:
Appraisers may apply an obsolescence factor to newer assets if the overall asset age mix is out of balance.

Note 2:
Schedules for items with 15 year or greater lives normally apply only to certain types of industrial machinery and equipment. Generally, items of this type are maintained in a manner resulting in low effective ages. Industrial appraisers adjust for lesser degrees of maintenance through application of service factors.

Note 3:
The default year life for MISC or M&E by SIC is a guideline for the assets typical of businesses within the SIC. In some cases, specific assets may have a shorter or longer year life than what is typical for the asset category. The default year life is not intended to limit the age-life classification in these categories or the judgment of the appraiser.

Note:
If 50% or more of the total cost of an asset category is reported in the eligible NAM years for the category (these NAM years are boxed on this chart), then the NAM schedule is used to calculate the value. If less than 50% of the total cost of an asset category is reported in the eligible NAM years for the category, then the % GD schedule is used to calculate the value.
